

# Agile Software Testing Using Visual Studio 2013

ATVS2013 | 3 Days

Software testing on an Agile team is fundamentally different than traditional approaches to testing. This three-day course will introduce you to contemporary testing principles and practices used by Agile teams to deliver high-quality increments of software on regular iterations.

## Why should you take this class?

This course is appropriate for all members of a software development team, especially those team members performing testing activities – regardless of skill level. This course also provides value for non-testers (managers, Scrum Masters, coaches, etc.) who want a better understanding of what Agile software testing involves.

You should take this class if any of these issues sound familiar:

- Release dates and budgets are missed due to low quality and bugs
- Testing activities are performed at the end of the sprint/iteration or release
- No collective ownership or collaboration exists between the developers and testers
- The team tests the wrong things at the wrong time
- No automated tests, no regression tests, and no idea of the quality of your software!

## Course content

This course contains several modules, each covering a different set of Agile practices and related tools.

### 1. AGILE SOFTWARE DEVELOPMENT

- Agile values and principles, the Scrum framework
- Cross-functional teams, Agile testing behaviors

### 2. AGILE SOFTWARE REQUIREMENTS

- Requirements vs. specifications, acceptance criteria, estimation

### 3. PLANNING AND TRACKING QUALITY

- Forecasting and planning a sprint, defining done, reporting bugs

### 4. DEVELOPMENT TESTS

- Unit testing, code coverage, Test-Driven Development (TDD)

### 5. ACCEPTANCE TESTS

- Acceptance testing, integration testing, UI testing
- Performance testing, load testing, non-functional requirements
- Acceptance Test-Driven Development (ATDD)

### 6. EXPLORATORY TESTS

- Exploratory testing, testing “tours”

### 7. BUILD AND TEST AUTOMATION

- Automated building and testing, Continuous Integration (CI)

### 8. GETTING DONE

- Overcoming common dysfunctions, attributes and behaviors of high-performance Agile teams

### VISUAL STUDIO CONCEPTS

- Visual Studio Online
- Team Projects
- Managing a backlog
- Planning a sprint
- Creating a test case
- Reporting a bug
- Create and run a unit test
- Calculate code coverage
- Concurrent testing (NCrunch)
- Microsoft Test Manager
- Coded UI tests
- Web performance tests
- Load tests
- Exploratory testing
- Automated builds
- Visual Studio Agents

Students will work in teams on a common case study using Visual Studio Online to plan and track their work.

No technical skills or experience are required. All technical concepts will be explained during class.

All source code will be provided. Knowledge of Agile and Scrum is a plus.
